RPZ-6.0 Series / Power Module

6.0 Amp / 2.75-7.0VDC / 24 Pad QFN Package

RECOM DC/DC Converter

FEATURES

- Buck regulator with integrated shielded inductor
- 7V maximum input voltage
- Programmable 0.6-6.65V output voltage
- 6A maximum output current
- SCP, OCP, OTP, and UVLO protection
- 4mm x 6mm x 1.6mm QFN package
- Efficiency up to 90%
- 3 year warranty

Dimensions (LxWxH): 4.0 x 6.0 x 1.6mm (0.157 x 0.236 x 0.063inch)
0.1g (0.0002lbs)

DESCRIPTION

The RPZ-6.0 series is a cutting-edge non-isolated step-down power module meticulously crafted for electronic designs across a diverse spectrum of applications. This versatile module is poised to empower microcontrollers, sensors, embedded systems, portable electronics, IoT devices, consumer electronics, and medical devices with efficient and reliable power. The RPZ-6.0 is a buck regulator power module featuring an integrated shielded inductor, ensuring optimal performance and ease of use in various scenarios. With a maximum input voltage of 7V, this module strikes the perfect balance between adaptability and efficiency, providing a stable and reliable power source for a wide array of applications. Designed for flexibility, the RPZ-6.0 allows for programmable output voltages ranging from 0.6V to 6.65V. This adaptability makes it an ideal choice for applications with varying power requirements, enabling seamless integration into designs that demand precision and customization. Delivering a robust 6A maximum output current, the RPZ-6.0 is engineered to meet the dynamic needs of modern electronics. Safety is paramount, and this module is equipped with Short Circuit Protection (SCP), Overcurrent Protection (OCP), Overtemperature Protection (OTP), and Undervoltage Lockout (UVLO) features, ensuring the longevity and safeguarding of connected devices. Housed in a compact 4mm x 6mm x 1.6mm QFN package, the RPZ-6.0 is designed to optimize space efficiency without compromising performance. The integration of Flip-Chip technology enhances thermal management, ensuring the module operates at peak efficiency even in demanding conditions. With an efficiency rating of up to 90%, the RPZ-6.0 not only meets but exceeds industry standards. This high efficiency not only minimizes energy consumption but also reduces heat generation, contributing to the overall reliability and extended lifespan of the module.

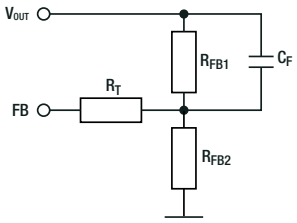
OUTPUT VOLTAGE SETTING

The RPZ-6.0 series offers the feature of trimming the output voltage by using external trim resistors (see **„Typical Application“**). The external resistor divider is used to set the output voltage. First, choose a value for R_{FB2}. R_{FB2} should be chosen carefully, as too small a value leads to considerable quiescent current loss while too great a value makes FB noise sensitive. It is recommended to choose a value between 2kΩ and 100kΩ for R_{FB2}. Typically, setting the current through R_{FB2} to less than 250µA provides a good balance between system stability and minimal load loss. Then R_{FB1} can be calculated with Equation. The values for trim resistors shown in trim tables below are according to standard E96 values; therefore, the specified voltage may slightly vary.

Feedback Network



Calculation:

$$R_{FB1} = \frac{Vout - Vref}{Vref} * R_{FB2}$$

Practical example with V_{OUT}= 1.8VDC

$$R_{FB1} = \frac{1{,}8V - 0{,}6V}{0{,}6V} * 10k\Omega = 20k\Omega$$

Table below lists recommended resistor values for common V_{OUT}:

V_{OUT} [VDC]	R_{FB1} [Ω]	R_{FB2} [Ω]	C_F [pF]	R_T [Ω]
1.0	6k67	10k	39	0
1.2	10k			
1.5	15k			
1.8	20k			
2.5	31k6			
3.3	45k

Pad Information

Pad #	Function	Description
1, 2, 3, 4, 5, 24	PGND	System Ground. This pin is the reference ground of the regulated output voltage. Because of this, extra care must be taken when laying out the PCB. It is recommended to connect this pin to GND with copper and vias.
6	VCC	Internal bias supply output.
7, 8, 13, 14, 23	SW	Switch output. This pin can be left floating.
9, 10, 11, 12	OUT	Output pin. Connect this pin to COUT.
15	BST	Bootstrap. Internal capacitor connected between SW and BST pins to form a floating supply across the high-side switch driver.
16	CTRL	Enable. Pull CTRL high to enable the part. When floating, CTRL is pulled down to FND by internal 3.3MΩ resistor and is disabled.
17	FB	Feedback. Sets the output voltage when connected to the tap of an external resistor divider that is connected between output and GND.
18	AGND	Signal ground. AGND is not internally connected to PGND, so ensure that AGND is connected to PGND in the PCB layout.
19	SS	Soft start. Connect a capacitor across SS and GND to set the soft-start time and avoid start-up inrush current. This pin includes an internal 22nF SS capacitor.
20, 21	PG	Power good output. The output of this pin is an open-drain output. Its state changes UVP, OCP, OTP or OV occurs.
22	VIN	Supply Voltage. The part operates from a 2.75V to 7V input rail. C1 is necessary to decouple the input rail. Use a wide PCB trace to make the connection.
